7 IN THE UNITED STATES DISTRICT COURT
8 FOR THE WESTERN DISTRICT OF WASHINGTON
9 AT SEATTLE

10 SPOKANE RIVERKEEPER, a program
11 of the Center for Justice

12 Plaintiff,

13 NO.

14 v.

15 COMPLAINT

16 UNITED STATES ENVIRONMENTAL
17 PROTECTION AGENCY,

18 Defendant.

19

NATURE OF ACTION

20 1. This action challenges the Environmental Protection Agency’s (“EPA”) decision
21 to approve a Total Maximum Daily Load (“TMDL”) for the Hangman Creek, ordering
22 defendants to comply with the requirements of the Clean Water Act, 33 U.S.C. § 1251 *et seq.* and
23 the Administrative Procedure Act (“APA”), 5 U.S.C. § 701 *et seq.* The decision approving the
24 TMDL was arbitrary and capricious, an abuse of discretion, and/or otherwise not in accordance
25 with law.

26 2. Hangman Creek is a waterbody that has suffered from terrible water quality
caused by poor farming practices for years. Pollutants such as fecal coliform, turbidity, and high

1 water temperature have impaired Hangman Creek to levels well below those established by the
 2 Clean Water Act (“CWA”).

3 3. The sources of pollution in the Hangman Creek Watershed are numerous and
 4 diverse. Agricultural pollution is by far the biggest source of pollution throughout the watershed.
 5 Poor agricultural practices, such as animal waste runoff, inadequate soil tillage, and a lack of
 6 riparian buffers, are frequent nonpoint sources of pollution. Point sources of pollution in the
 7 watershed include multiple wastewater treatment plants.

8 4. The CWA contemplates that adequate water quality will be achieved by the use of
 9 the National Pollutant Discharge Elimination System (“NPDES”) permits issued to point sources
 10 of pollution. When the NPDES permits do not achieve adequate water quality standards for a
 11 water body, the CWA requires that a Total Maximum Daily Load (“TMDL”) be established. A
 12 TMDL accounts for all point sources of pollution and all nonpoint sources of pollution and then
 13 determines the level that each source of pollution needs to be reduced in order to achieve
 14 adequate water quality standards.

15 5. Under the CWA, either Ecology or the EPA is required to establish a TMDL for
 16 impaired waters “at a level necessary to implement the applicable water quality standards with
 17 seasonal variations and a margin of safety which takes into account any lack of knowledge
 18 concerning the relationship between effluent limitations and water quality.” 33 U.S.C. §
 19 1313(d)(1)(C). If Ecology creates a TMDL, the EPA must either approve the TMDL or
 20 disapprove the TMDL. If EPA disapproves the submitted TMDL, the EPA is responsible for
 21 establishing a new TMDL. 33 U.S.C. § 1313(2).

22 6. In order to begin the process of improving water quality in Hangman Creek, the
 23 Washington Department of Ecology (“Ecology”) created a TMDL for fecal coliform, total

1 suspended solids, and temperature within Hangman Creek. As required by the CWA, Ecology
 2 submitted the Hangman Creek TMDL to the Environmental Protection Agency (“EPA”) for
 3 approval.

4 7. The EPA approved the Hangman Creek TMDL on September 29, 2009. However,
 5 the EPA ignored the CWA and EPA’s own long-standing regulations and policies that guide
 6 approvals of TMDLs and provided no explanation why it was deviating from its policies.
 7 Specifically, the EPA ignored its own policies that require adequate reasonable assurances that
 8 nonpoint sources of pollution will be reduced in impaired waters polluted by both point sources
 9 and nonpoint sources of pollution. *See Guidance for Water Quality-Based Decisions: the TMDL*
 10 *Process*, EPA440/4-91-001 (April 1991) (“In order to allocate loads among both point and
 11 nonpoint sources, there must be reasonable assurances that nonpoint source loads will in fact be
 12 achieved. Where there are not reasonable assurances, under the CWA, the entire load reductions
 13 must be assigned to point sources.”); *New Policies for Establishing and Implementing Total*
 14 *Maximum Daily Loads* (1997) (“[W]here any wasteload allocation to a point source is increased
 15 based on an assumption that loads from nonpoint sources will be reduced, the State must provide
 16 ‘reasonable assurances’ that the nonpoint source load allocations will in fact be achieved.”);
 17 *Guidelines for Reviewing TMDLs under Existing Regulations Issued in 1992* (2002) (“When a
 18 TMDL is developed for waters impaired by both point and nonpoint sources, and the WLA is
 19 based on an assumption that nonpoint source load reductions will occur, EPA’s 1991 TMDL
 20 Guidance states that the TMDL should provide reasonable assurances that nonpoint source
 21 control measures will achieve expected load reductions in order for the TMDL to be
 22 approvable.”). The EPA also ignored CWA requirements to establish an adequate margin of
 23
 24
 25
 26

1 safety in the TMDL and to establish loads at a level to implement applicable water quality
2 standards.

8. Plaintiff requests that the Court set aside the TMDL approval pursuant to 5 U.S.C.
4
§ 706(2)(a) and enjoin EPA to create a new TMDL which complies with the requirements of the
5
CWA.
6

7 9. Plaintiff seeks a declaratory judgment, injunctive relief, an award of costs and
8 expenses of suit, including attorney and expert witness fees pursuant to the Equal Access to
9 Justice Act (“EAJA”), 28 U.S.C. § 2412, and such other relief as this Court deems just and
10 proper.

JURISDICTION

13 10. Jurisdiction is proper in this Court under 28 U.S.C. § 1331 because this action
14 arises under the laws of the United States and involves the United States as a defendant, and
15 under the APA, 5 U.S.C. § 702, providing for judicial review of final agency action. The Court
16 can grant declaratory and injunctive relief under 28 U.S.C. § 2201 (declaratory judgment), 28
17 U.S.C. § 2202 (injunctive relief), and under 5 U.S.C. §§ 701-706 for violations of the APA and
18 the CWA.

PARTIES

23 12. Plaintiff Spokane Riverkeeper is a program of the Center for Justice, a non-profit
24 organization, incorporated under the laws of Washington and recognized by the Internal Revenue
25 Service as a tax-exempt organization under Section 501(c)(3) of the Internal Revenue Code.
26 Spokane Riverkeeper's donors and supporters reside on or near or recreate in the Spokane River

1 Watershed. Spokane Riverkeeper is located at 35 W. Main Avenue, Suite 300, Spokane, WA
2 99201. Spokane Riverkeeper is dedicated to protecting and restoring the health of the Spokane
3 River Watershed. Spokane Riverkeeper accomplishes its goals by collaborating, educating, and,
4 when necessary, litigating to preserve the Spokane River's health through the Clean Water Act
5 and other laws. The goal of Spokane Riverkeeper is to achieve a fishable and swimmable
6 Spokane River.

8 13. Defendant EPA is the federal agency charged with the administration and
9 enforcement of the CWA. EPA retains final approval and oversight of state-run water quality
10 programs under the CWA, including approval of water quality standards and TMDLs issued by
11 states. EPA is headquartered in Washington, D.C. EPA Region 10 is headquartered in Seattle,
12 Washington. EPA Region 10 provided the final approval of the Hangman Creek TMDL. EPA
13 Region 10 is located at 1200 6th Avenue, Suite 900, Seattle, WA 98101.
14

STATEMENT OF STANDING

16 14. The interests at stake in this matter are germane to Plaintiff Spokane Riverkeeper's
17 organizational purposes. The EPA's violations of law as set forth in the claims for relief herein
18 threaten the water quality of Hangman Creek and the Spokane River, preservation of wildlife and
19 fish in Hangman Creek and the Spokane River, and the use and enjoyment of the Hangman Creek
20 and Spokane River for Plaintiff's members.

22 15. Plaintiff and its members recreate, fish, swim, and otherwise use and enjoy the
23 Spokane River and its tributary Hangman Creek. Plaintiff and its members plan to continue their
24 use and enjoyment of the Spokane River and its tributary Hangman Creek in the future. Plaintiff
25 and its members also participate in information gathering and dissemination, education and
26 public outreach, commenting upon proposed agency actions, serving on advisory committees, and

1 other activities relating to Ecology and EPA's management and administration of the Spokane
2 River and its tributary Hangman Creek.

16. Defendant EPA's unlawful approval of the Hangman TMDL adversely affects
4 Plaintiff's organizational interests, as well as its members' use and enjoyment of the Spokane
5 River and Hangman Creek. The interests of the Plaintiff and its members have been and will
6 continue to be injured and harmed by the EPA's unlawful approval of the Hangman Creek
7 TMDL. This decision is particularly and directly harmful to Plaintiff's interests because
8 Defendant EPA has failed to perform its duties under federal law as set forth herein. Unless the
9 relief prayed for herein is granted, Plaintiff and its members will suffer ongoing and irreparable
0 harm and injury to their interests.
1

3 17. The injures to Plaintiff Spokane Riverkeeper are likely to be redressed by a
4 favorable decision of this Court because an order granting the relief requested in this Complaint
5 would ensure that the TMDL is in compliance with federal law and not result continued degraded
6 water quality of Hangman Creek and the Spokane River.

STATUTORY AND REGULATORY FRAMEWORK

8 18. TMDLs are the backstop of a detailed statutory and regulatory framework under
9 the CWA that provides the last regulatory resort of improving water quality.

Overview of the Clean Water Act

22 19. The CWA provides a series of actions that the regulatory body can take to improve
23 water quality standards: (i) establishment of water quality standards by the states and approved
24 by EPA under Section 303(c); (ii) issuance of National Pollutant Discharge Elimination System
25 (“NPDES”) permits to point sources of pollution with pollutant limits designed to meet
26 applicable water quality standards; (iii) identification by the states of certain waters that are not

1 meeting water quality standards under Section 303(d) (commonly called “impaired” waters); and
 2 (iv) calculation by the states or EPA of a total maximum daily pollutant load—a TMDL—for
 3 such impaired waters under Section 303(d).

4 20. The CWA divides sources of pollutants to waterways into two major categories:
 5 “point sources” and “nonpoint sources.” “Point source” is defined at 33 U.S.C. § 1362 to mean
 6 “any discernible, confined, and discrete conveyance including...any pipe, ditch, channel, tunnel,
 7 [or] conduit...from which pollutants are or may be discharged.” The term also includes those
 8 livestock and poultry operations that qualify under EPA regulations as a “concentrated animal
 9 feeding operation.” Nonpoint sources are not defined at 33 U.S.C. § 1362 and are not regulated
 10 under the NPDES program. However, Ecology has the power to regulate nonpoint sources of
 11 pollution under the Washington State Water Pollution Control Act. *See Lemire v. Department of*
 12 *Ecology*, 178 Wn.2d 227 (2013).

13 21. All pollutant discharges to waters of the United States from point sources are
 14 prohibited under the CWA unless otherwise specifically authorized under separate sections of the
 15 CWA. One primary way in which discharges are authorized is under a Section 402 permit,
 16 known as a NPDES permit. *Id.* at § 1342. The NPDES permitting system imposes limits on such
 17 discharges based on the application of technology, or the need to achieve water quality standards,
 18 whichever is more stringent. *Id.* §§ 1311(b), 1312. States can assume primary responsibility for
 19 administration and enforcement of the NPDES permitting program if the state’s program is
 20 approved by the EPA. *Id.* §§ 1342(b), 1342(c)(1). Otherwise, EPA is responsible for the
 21 NPDES permitting system in that particular state. *Id.* § 1342(a). EPA retains authority to object
 22 to a particular NPDES permit that authorizes discharges to waters within the statute’s jurisdiction.
 23 *Id.* § 1342(d); 40 C.F.R. § 123.44.

Development of Water Quality Standards

22. Each state must designate one or more uses for its water bodies, and then must
2 develop water quality criteria for each water body necessary to protect these designated uses,
3 taking into account the water body's use and value for public water supplies, propagation of fish
4 and wildlife, recreational, agricultural, and industrial purposes, use for navigation, and other
5 purposes. 33 U.S.C. § 1313(c)(2)(A); 40 C.F.R. §§ 131.10 and 131.11. These criteria can be
6 expressed for a pollutant as specific numeric quantities or as general narrative statements, but in
7 either case, must be based on "sound scientific rationale." 40 C.F.R. § 131.11(a). The standards
8 adopted by the states are subject to EPA review and approval to ensure that they are consistent
9 with CWA requirements. 33 U.S.C. § 1313(c)(3)-(4). If the EPA determines that the water
10 quality standards promulgated by the states are not consistent with the CWA, then the EPA can
11 disapprove the standards and promulgate its own water quality standards for the state. *Id.* §
12 1313(c)(3).

Development of TMDLs for Impaired Waters

17 23. Section 303(d) of the CWA directs each state to first identify those waters within
18 its boundaries for which technology-based NPDES permit limitations are not stringent enough to
19 implement the applicable water quality standards, and then each state must establish a priority
20 ranking of these waters, taking into account the severity of the pollution and the waters'
21 designated uses. 33 U.S.C. § 1313(d)(1)(A). The state must establish a TMDL for each listed
22 water (commonly referred to as "impaired" waters) for pollutants identified by EPA as suitable
23 for such calculation. *Id.* § 1313(d)(1)(C). This TMDL must be established "at a level necessary
24 to implement the applicable water quality standards," accounting for seasonal variations and a
25 margin of safety. *Id.* EPA retains final approval of TMDLs, and the EPA can create its own

TMDL if the state's TMDL does not set loads at levels necessary to implement water quality standards. *Id.*

24. A TMDL is the measure of the total amount of pollutant that can be “loaded” into a waterbody and still meet water quality standards. From this total number, portions of the total load are allocated to individual sources of pollution. Under EPA regulations, a TMDL is the sum of both “wasteload allocations” (“WLAs”)—the portion of the receiving water loading capacity allocated to each of its existing or future point sources of pollution—and “load allocations” (“LAs”)—the loading capacity portions attributed to the water body’s “existing or future nonpoint sources of pollution or to natural background sources.” 40 C.F.R. § 130.2.

The Elements of a TMDL

25. Waters that are polluted by point and nonpoint sources of pollution have an additional requirement under EPA policy. After the necessary LAs and WLAs have been allocated to sources of pollutants, EPA policy requires a TMDL to establish reasonable assurances that WLAs for nonpoint sources of pollution will be achieved in order to not allocate all reductions to LAs from point sources of pollution. *See* 2002 “Guidelines for Reviewing TMDLs under Existing Regulations Issued in 1992.”

FACTUAL BACKGROUND

The Hangman Creek Watershed

26. Hangman Creek is a trans-boundary watershed that begins in the foothills of the Rocky Mountains of northern Idaho, extends over the southeastern portion of Spokane County, Washington, and terminates as a tributary of the Spokane River. The entire Hangman Creek watershed encompasses an area of over 689 square miles.

27. The Hangman Creek watershed is dominated by dryland farming. Wheat, cattle, hogs, and other agriculture is common throughout the watershed. The Hangman Creek watershed has experienced an increase in urbanization and a change in land use practices, especially near its terminus with the Spokane River, but the farming is the predominant land use throughout the watershed.

28. Poor farming practices have left Hangman Creek in dire ecological health. Cattle and other livestock are often allowed to graze directly next to, and sometimes in, the water. Farmlands used for wheat production are often tilled and left to lie fallow, which results in large amounts of soil being swept away into Hangman Creek. Fields are often tilled and planted right up to the edge of the creek with no riparian buffers. This results in higher water temperatures due to a lack of shade. The lack of riparian buffers also cause erosion of streambanks, furthering contributing to the poor water quality. Overall, the ecological health of the stream has greatly suffered thanks to poor farming practices throughout the watershed.

The Hangman Creek TMDL

29. In 1998, Ecology identified several parts of Hangman Creek as impaired for not meeting state water quality standards for fecal coliform, dissolved oxygen, pH, and temperature. Parts of Hangman Creek have remained on the impaired waters list ever since then.

30. In response to Hangman Creek's inclusion on the impaired waters list, Ecology began developing a TMDL for three pollutants that have plagued the waterbody: fecal coliform, turbidity, and temperature.

31. Fecal coliform is a reliable indicator of the presence of disease-carrying organisms which can pose a direct threat to human health. When fecal coliform bacteria are present in high numbers in a water sample, it means that the water has received fecal matter from an outside

1 source. Many areas in the Hangman Creek watershed have fecal coliform counts high enough to
 2 pose a health risk to swimmers, fisherman, and others. The majority of fecal coliform is
 3 produced by livestock, but wastewater treatment plants, stormwater discharges, and leaking septic
 4 tanks can also contribute fecal coliform to the waterbody.

5 32. Water temperature is another important marker of ecological health in a stream.
 6 Elevated temperature typically decreases the level of dissolved oxygen of water. This can
 7 negatively impact aquatic wildlife by literally asphyxiating them due to a lack of oxygen. The
 8 lack of oxygen caused by warmer water also can lead to anaerobic conditions, which lead to
 9 increased bacteria levels when there is an ample food supply. In the Hangman Creek watershed,
 10 a lack of shade is the main contributing factor to increased water temperature. Farmlands are
 11 often tilled to the very edge of the water and do not leave a riparian buffer, such as willows or
 12 other shade-producing trees. The cumulative result is a waterbody that is simply too warm to be
 13 healthy.

14 33. Turbidity refers the measure of total suspended solids (“TSS”) present in water.
 15 The solids can include a wide variety of material, such as silt, decaying plant and animal matter,
 16 industrial wastes, and sewage. In Hangman Creek, the main cause of turbidity is silt caused by
 17 soil runoff from farmlands. Since 1939, total erosion on Palouse region cropland has averaged
 18 360 tons per acre—more than 9 tons per acre per year. Streams, such as Hangman Creek, are
 19 forced to serve as the conduits for all of the eroded soil. High TSS can block light from reaching
 20 submerged vegetation, leading to a decrease in vegetation growth and a decrease in dissolved
 21 oxygen produced. Increased sediment can also clog fish gills, reduce growth rates, decrease
 22 resistance to disease, and prevent egg and larval development. Once suspended solids settle to
 23 the bottom of a waterbody, the solids can smother the eggs of fish and aquatic insects. Finally,
 24
 25
 26

1 the highly turbid water can severely hamper the aesthetic quality of the waterbody by creating
 2 cloudy water. Hangman Creek suffers from high turbidity, especially during storm events which
 3 wash soils from farmlands into the water. The highly turbid water of Hangman Creek dumps
 4 directly into the Spokane River, where it often creates a visible mixing line with the clearer water
 5 of the Spokane River.
 6

7 34. After evaluating the Hangman Creek watershed, Ecology developed a TMDL
 8 which set WLAs and LAs for fecal coliform, temperature, and turbidity through the Hangman
 9 Creek watershed in Washington. The TMDL covered 446 square miles of the 689 square miles
 10 of the total watershed—the remaining 243 square miles of the watershed occurring in Idaho.

11 35. Hangman Creek and its tributaries have not been given any specific use
 12 designations in the water quality standards. Under Washington Administrative Code 173-201A-
 13 600, default water quality standards apply. The designated uses to be protected are : Salmonid
 14 spawning rearing, and migration; primary contact recreation; domestic, industrial, and
 15 agricultural water supply; stock watering; wildlife habitat; harvesting; commerce, and navigation;
 16 boating; and aesthetic values.
 17

18 36. The TMDL focuses on water quality criteria derived from the beneficial uses of
 19 recreation and aquatic habitat. The TMDL does not derive water quality criteria from the
 20 beneficial use of aesthetic values, despite the fact that Hangman Creek's aesthetic value is often
 21 impaired due to high turbidity levels.
 22

23 37. The TMDL identifies the amount of reductions in pollutants necessary from
 24 WLAs or LAs necessary to meet water quality standards. This is accomplished by identifying
 25 certain sites, such as the mouths of tributaries to Hangman Creek or Hangman Creek where it
 26 intersects certain roads, and then identifying the reduction in a pollutant at a certain site necessary

1 to meet water quality standards. For example, Ecology identified that Hangman Creek at Keevy
 2 Road would need a 78% reduction in fecal coliform LAs in order to achieve the water quality
 3 standards for fecal coliform in the watershed. Ecology determined that some sites needed drastic
 4 reductions in LAs in order to meet water quality standards—up to 92% in some cases.
 5

6 38. Ecology did not require any further reductions in WLAs from six municipal
 7 wastewater treatment plants in the watershed, except for a reduction in the fecal coliform WLA
 8 for the Tekoa wastewater treatment plant. Ecology determined that the existing limits on
 9 pollutants established in each treatment plants NPDES permit was adequate to meet water quality
 10 standards.

11 39. In effect, Ecology placed all of the burden for meeting water quality standards on
 12 reducing pollutants from nonpoint sources of pollution and the LAs assigned to them.
 13

Inadequacies of the TMDL

15 40. Reducing primarily LAs from nonpoint sources and not WLAs from point sources
 16 to meet water quality standards was done because the vast majority of pollution in Hangman
 17 Creek originated from nonpoint sources of pollution.

18 41. However, in order to allow WLAs to remain the same, EPA policy requires the
 19 TMDL to contain “reasonable assurances” that LAs will be reduced. For instance, EPA’s 2002
 20 policy, “Guidelines for Reviewing TMDLs under Existing Regulations,” states in part:
 21

22 When a TMDL is developed for waters impaired by both point and
 23 nonpoint sources, and the WLA is based on an assumption that
 24 nonpoint source load reductions will occur, EPA’s 1991 TMDL
 25 Guidance states that the TMDL should provide reasonable assurances
 26 that nonpoint source control measures will achieve expected load
 reductions in order for the TMDL to be approvable. This information
 is necessary for EPA to determine that the TMDL, including the load
 and wasteload allocations, has been established at a level necessary to
 implement water quality standards.

1 Guidelines for Reviewing TMDLs under Existing Regulations Issued in 1992 (2002). The logic is
 2 simple: reductions in pollutants must come from somewhere. So if WLAs are not being reduced,
 3 then there must be some sort of reasonable assurance that LAs will be reduced. If there are no
 4 reasonable assurances that LAs are going to be reduced, then under the CWA, the entire load
 5 reductions must be assigned to point sources. Simply identifying the amount of pollutant reduction
 6 necessary from LAs is not enough. There must be a reasonable assurance that those LA reductions
 7 will occur—otherwise the burden falls to WLAs from point sources.
 8

9 42. The Hangman Creek TMDL fails to provide the reasonable assurances that LAs
 10 will be reduced enough to satisfy the CWA. The “Reasonable Assurances” section of the
 11 Hangman Creek TMDL is essentially a list of organizations that might be able to provide
 12 assistance implementing best management practices for nonpoint sources of pollution at
 13 unspecified locations in the watershed at some unspecified point in the future.

14 43. The “Reasonable Assurances” section of the Hangman Creek TMDL does not
 15 include reasonable assurances of LA reductions that are enforceable, transparent, not voluntary,
 16 or currently funded. In effect, the “reasonable assurances” identified in the Hangman Creek
 17 TMDL are meaningless.

18 44. Without adequate reasonable assurances, the loads determined within the
 19 Hangman Creek TMDL will not all implement applicable water quality standards.

20 45. The CWA requires each TMDL to employ a “margin of safety which takes into
 21 account any lack of knowledge concerning the relationship between effluent limitations and water
 22 quality.” 33 U.S.C. 1313(d)(1)(C). Ecology used an “implicit” margin of safety within the
 23 Hangman Creek TMDL. An explicit margin of safety sets aside a portion of the load capacity

specifically for the margin of safety, but an implicit margin of safety relies upon conservative assumptions in the use of data and the application of models.

46. The implicit margin of safety in the Hangman Creek TMDL relies upon the assumption that reductions in LAs will actually occur and that the WLAs and LAs are set at levels that will implement water quality standards. Unfortunately, both of these assumptions are incorrect and the margin of safety established in the TMDL is not adequate.

47. Despite these inconsistencies with the CWA and EPA regulations and policy, the
EPA approved the Ecology-created Hangman Creek TMDL on September 29, 2009. EPA did not
give any explanation why it was deviating from its well established policies.

48. Since the adoption of the TMDL, Hangman Creek has continued to suffer degraded water quality. Segments of the stream remain on the impaired waters list established by Ecology. Poor agricultural practices remain the main source of pollutants in the Hangman Creek watershed.

FIRST CLAIM FOR RELIEF

Failure to Include Reasonable Assurances and an Adequate Margin of Safety

(Pursuant to the APA, 5 U.S.C. § 702)

49. The foregoing paragraphs are realleged and incorporated by reference.

50. The Hangman Creek TMDL assigns WLAs to point sources of pollution in the TMDL that are based on the assumption that LAs from nonpoint sources of pollution will be reduced.

51. The Hangman Creek TMDL does not contain adequate reasonable assurances of LA reduction.

52. The Hangman Creek TMDL does not contain an adequate margin of safety.

53. Despite the lack of reasonable assurances, EPA approved the Hangman Creek TMDL without any explanation or justification of why its own policy was not applicable.

54. Without adequate reasonable assurances, EPA has approved a TMDL with WLAs and LAs at levels that will not implement applicable water quality standards, in violation of 33 U.S.C. § 1313(d)(1)(C).

55. For these reasons, EPA's approval of the Hangman Creek TMDL is arbitrary and capricious, an abuse of discretion, or otherwise not in accordance with law in violation of 5 U.S.C. § 706.

56. Plaintiffs are entitled to their reasonable fees, costs, and expenses associated with this litigation pursuant to the EAJA, 28 U.S.C. § 2412.

SECOND CLAIM FOR RELIEF

Failure to Address All Applicable Water Quality Standards

(Pursuant to the APA, 5 U.S.C. § 702)

57. The foregoing paragraphs are realleged and incorporated by reference.

58. The Hangman Creek TMDL does not address all applicable water quality standards, in violation of 33 U.S.C. § 1313(d)(1)(C) and EPA's implementing regulations at 40 C.F.R. Part 130. Specifically, the Hangman Creek TMDL does not address the beneficial designated use of aesthetic values.

59. For these reasons, EPA's approval of the Hangman Creek TMDL is arbitrary and capricious, an abuse of discretion, or otherwise not in accordance with law in violation of 5 U.S.C. § 706.

60. Plaintiffs are entitled to their reasonable fees, costs, and expenses associated with this litigation pursuant to the EAJA, 28 U.S.C. § 2412.

PRAYER FOR RELIEF

WHEREFORE, Plaintiff Spokane Riverkeeper respectfully requests this Court to enter judgment in its favor, and:

1. Declare that the Hangman Creek TMDL is contrary to federal law, including the Clean Water Act, federal regulations, and EPA policies, or is otherwise arbitrary, capricious, or an abuse of discretion.
2. Vacate the Hangman Creek TMDL.
3. Enjoin and require EPA to issue a TMDL that conforms to the requirements of the Clean Water Act and Administrative Procedure Act as ordered by this Court.
4. Award the Plaintiff their costs, expenses, expert witness fees, and reasonable attorneys' fees associated with this litigation pursuant to the Equal Access to Justice Act, Clean Water Act, and all other applicable authorities; and
5. Grant Plaintiff Spokane Riverkeeper such other relief as may be necessary and appropriate or as the Court deems just and proper.

Dated this 28th day of September, 2015.

Respectfully submitted,

BRICKLIN & NEWMAN, LLP
